

ABSTRACT OF THE DISCLOSURE

A photocurable composition comprising the following components (A) to (D):

(A) at least one of the (meth)acrylates having the structures shown by the formulas (1) and (2),

wherein R^1 represents a hydrogen atom or a halogen atom excluding a fluorine atom, R^2 is a hydrogen atom, a halogen atom excluding a fluorine atom, $\text{Ph-C(CH}_3)_2$ -, Ph- , or an alkyl group having 1-20 carbon atoms, and R^3 represents $-\text{CH}_2-$, $-\text{S-}$, or $-\text{C(CH}_3)_2-$;

(B) a (meth)acrylate having three or more functional groups, excluding the (meth)acrylates of the component (A);

(C) a radical photoinitiator; and

(D) a polycarbonate polyol having a hydroxyl value of 10-100;

wherein 5-50 wt% of the total acrylic components in the composition are methacrylate compounds. A photocurable composition produces a cured product possessing a high refractive index, excelling in heat resistance, showing only a small amount of warping, and being particularly useful as an optical part such as a prism lens sheet.
